

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A shielded wire harness comprising:
a plurality of wires arranged to be juxtaposed to one another;
a plurality of wire terminals each connected to a terminal portion of the respective wires, and each configured to be connected to a respective terminal disposed in a shield case of equipment; and
a shielding member having a tubular shape and flexible characteristic and configured to enclose the plurality of wires collectively, and an end portion thereof is configured to be connected to the shield case,
wherein the shielding member comprises:
an intermediate shielding member configured to enclose the plurality of wires collectively except for the terminal portion; and
a terminal shielding member connected to the intermediate shielding member and having larger diameter than that of the intermediate shielding member, and configured to enclose the plurality of wires collectively at the terminal portion where the plurality of wires are spread ~~apart~~ apart, the terminal shielding member and the intermediate shielding member being conductively connected to each other by having a front end portion of the intermediate shielding member and a rear end portion of the terminal shielding member clamped between an underlay pipe and a clamp ring.
2. (Currently Amended) The shielded wire harness as claimed in claim 1, wherein the terminal shielding member is configured by ~~a~~-braided wires formed by metal thin lines braided in a meshed manner.

3. (Currently Amended) A shielding member for collectively enclosing a plurality of wires arranged to be juxtaposed to one another and each configured to be connected to a respective terminal disposed in a shield case of equipment, the shielding member comprising:

an intermediate shielding member configured to enclose the plurality of wires collectively except for a terminal portion of the plurality of wires;

a terminal shielding member connected to the intermediate shielding member and having larger diameter than that of the intermediate shielding member, and configured to enclose the plurality of wires collectively at the terminal portion where the plurality of wires are spread apart, the terminal shielding member and the intermediate shielding member being conductively connected to each other by having a front end portion of the intermediate shielding member and a rear end portion of the terminal shielding member clamped between an underlay pipe and a clamp ring,

wherein an end portion of the terminal shielding member is configured to be connected to the shield case.

4. (Currently Amended) The shielding member as claimed in claim 3, wherein the terminal shielding member is configured by a-braided wires formed by metal thin lines braided in a meshed manner.
